About us.

It starts with passion.

In the cathedral city of Cologne, the cornerstone for innovative adhesive for gold leaf was laid in 1979. The noble gold leaf, enchanting and seemingly everlasting, demands high quality adhesives. The market launch of the Instacoll and KGGG-Systems followed soon after the founding of Kölner Gilding Products.

The advantages with the usage and the excellent quality of the gilding were immediately evident.

Today, the company Kölner Gilding Products GmbH has its registered office in Germany's golden city, Dresden. As a manufacturer, we occupy approximately 20 employees. Our own lab ensures constant development, and documents every batch.

Our enterprise embodies the core values/principles of gilder competence, customer orientation and reliability. Our business philosophy is to delight our customers with innovative and high quality, excellent customer service and a unique price-performance ratio. Passion and goal orientation are factors that make us a valued and notable partner for gilding projects all over the world.

Made in Germany

When we think of Germany, we think of flexibility, productivity and quality. To stay competitive, we use the newest manufacturing technologies with uncompromising quality standards and with love for smart, detailed solutions. Enjoy our high quality and „Made in Germany“ service!

Our products

The products from the Kölner Gilding Products Company

The quality of the gilding depends strongly on the adhesive.

Both gilder and restorer need products that are reliable, fully operational, and always of the same level of quality.

Our gilding tools are developed in cooperation with the gilding master and are tested in practice as well as at gilding courses. Our products are tested and therefore reliable when offered to specialized trade and our sales partners.

We offer professional products for every gilding method, both indoors and outdoors, classic or state-of-the-art.

Kölner Classic

„Kölner Classic“ products enable reliable historical gilding in the present day. They are not a new invention—they have been developed on a historical basis. This product line fully ensures professional gilding and associated restoration work again.

Kölner Classic Poliment

Poliment—also known as bole—is a clay-like substance. It serves as a base layer for the leaf gold when gilding poliment. It is applied to the prepared surface, which is usually Gesso. Gesso is a mixture of chalk and glue. The poliment layer and the underlying layer of Gesso create a layer that permits the polishing of gold with agate burnishers.

Poliment gilding can only be used on absorbing surfaces.

It is an unbound poliment (unprepared) and has to be prepared with gelatine or rabbit skin glue before it can be applied. This poliment is already processed with water to a paste.

Advantages:

- very good gradation
- no fish-eyeing
- excellent covering power
- needs little glue

Kölner Classic Oil Mixtion

Three different drying times are produced—3, 12 and 24 hours Mixtion. The drying time refers to the waiting time before application of the gold leaves. Nevertheless, this tip can only be valid as an approximate indication, since the right time for putting on the leaf metals depends primarily on application rate and the ambient air temperature. The Mixtion is suitable for interior gilding and exterior gilding.
